

Health Reporting Mechanism for Inter-Network Gateway

ABSTRACT OF THE DISCLOSURE

A method of monitoring the stability of a network includes polling an inter-network gateway to collect data related to the inter-network gateway. In one example, the data is related to one or more of a flowcache, a virtual private routed network, or an internet key exchange security association. The data can then be processed to generate a number of parameters and a health report can be generated based on the parameters.
